12 YEARS THE MANUAL FOR GROWERS,
BUILDERS AND ORGANISATIONS ACTIVE
IN GREENHOUSE BUILDING WORLDWIDE

Logistics:

always pushing for greater efficiency

Along with automation, the importance of mechanisation in the greenhouse is also increasing fast. In the effort to continue to reduce the cost price, growers are setting their sights on labour costs. To do this, improvements in the logistics process are essential.

“Automation of internal transportation”

Photo: Bogaerts GL

Within the horticultural sector, there are three main movements: the further mechanisation of internal transport, the further automation of cultivation operations and introducing robotics in harvest processes.

The supply industry for the greenhouse cultivation sector

is addressing this by continually developing new logistical innovations. This demands comprehensive knowledge of the sector combined with major efforts in engineering and software development for the often specific components of the integral logistics system used in the greenhouse or processing area.
